**EXPENDITURE EXPLANATION**

The proposed legislation may result in a decrease in state general fund and local government expenditures of an indeterminable amount. A reverse auction is a structured bid process that links web-based technology with traditional bidding methods to obtain lower prices for the customer. Pre-qualified vendors compete in a real-time online auction to determine the lowest responsible bidder. Essentially, a reverse auction is a type of auction in which the roles of buyers and sellers are reversed.

According to INPUT (a government procurement advisory group), "early adopters have recognized that they must be very selective when deciding what to purchase using these auctions because the process may be more costly than the competitive solicitation process." The reverse auction process does allow for the state to avoid any transaction in which the cost exceeds the amount budgeted. If this procedure is followed and administrative costs incurred in this process are less than what is saved using reverse auctions, savings of an indeterminable amount will result.

The DOA also notes that while many states have realized savings (Minnesota experienced a 10.6% savings from 2001-2004 and Florida saved 30.4% on purchases of paper and office supplies), others such as Texas realized a loss of 0.8% in 2004. In addition, potential savings are largely dependent upon the commodities being procured. Many states and municipalities have found that reverse auctions are cost effective when buying goods that have specifications that are clearly defined such as office paper, vehicles, office furniture, etc. However, IT purchases and technical services have specifications that are not as clear, which makes the process of evaluating much more difficult and less efficient.

The acceptance of businesses to participate in this auction will largely determine the impact on expenditures. The greater the number of participants, the more likely that competitive forces will reduce costs.

Two issues mentioned by INPUT (December 2004) should also be taken into consideration in allowing reverse auctions. The first is the potential economic impact of increase competition to in-state vendors against potential savings. Increased use of technology in this manner may have a negative impact on the state's businesses. To protect against this impact, (see pg 2)

**REVENUE EXPLANATION**

There is no anticipated direct material effect on governmental revenues as a result of this measure.

**CONTINUED EXPLANATION from page one:**

states are implementing ways to encourage use of local vendors as subcontractors and secondary participants in the process. Secondly, according to INPUT, the reverse auction process can encourage collusion between suppliers to keep prices high.

Finally, the DOA notes that some states have outsourced reverse auctioning while others have kept the administration in-house, which can increase personnel costs.
